

## Computational Chemistry and Materials Modeling

### Team project 3b

#### Topic: materials

Formulate your own project within the above defined topic or do one of the following projects.

1. Evaluate  $\text{KMnPO}_4$  as cathode material.
2. Evaluate polyfluorine as molecular donor in organic solar cells.

**Reminder:** This is a scientific project whose more or less complete solution has a complexity scale of a peer-reviewed publication. That is why a precise exhaustive solution is not required. But try to do your best, spending a reasonable amount of time (about 2 hours per week per team member). It is expected that you will take TA's advisory on team-projects. Prepare 10 min oral presentation (introduction, motivation, methodology, main results, conclusions) and be ready for additional 10 min of discussion. Very short written report is also required and should contain the information on participation of each team member.
